AGI ALPHA: Earned-Financed Enterprise Operation and Expansion

Montreal.AI / AGI ALPHA engineering campaign

30 October 2026

RESOURCE QUALIFICATION FAILED.
This is conditional native operating/growth evidence with an execution resource-envelope failure, not an overall registered confirmation pass. All eight businesses passed native financial, operating-semantic and top-report audits. Final kernel-reaped child usage was 1,416.974 CPU seconds, exceeding the preregistered 600 CPU-second phase cap; the process-group watcher undercounted usage. Full execution wall time was 484.16 seconds. Economic outcomes remain preserved at their actual evidence level. No additional local business experiments were performed.

Abstract

The registered design completed 8 separate simulated enterprises. In the central growth region, 2/2 met the predeclared commercial criteria. Independent checks reexecuted useful artifacts and replayed native financial records and operating semantics. These finite authored trajectories are not calibrated probabilities of real market success.

1 Achieved result

The registered design completed 8 separate simulated enterprises. In the central growth region, 2/2 met the predeclared commercial criteria. Independent checks reexecuted useful artifacts and replayed native financial records and operating semantics. These finite authored trajectories are not calibrated probabilities of real market success.

2 Evidence identity and qualification

This edition is completion015-confirmation-001. Its source, services, buyer seeds, learning rules, cost envelopes and risk criteria were registered before this fixed evaluation. Earlier connected014 source002 and expansion001 outcomes retain their original source and interruption identities; no balances or receipts were copied into these businesses. Every business uses actual deterministic service execution and a separate source-bound artifact checker. The checking roles share AI-session and host infrastructure; independent code paths are not external institutional certification. The operating, commercial and growth verdicts below remain separate: executed with independent financial and operating semantic audit; conditional commercial success; conditional increase in profitable delivery.

3 Representative enterprise

The first registered central growth enterprise collected $1,153.366125 from 36 settled complete deliveries to 13 paying customers, including 10 repeat customers. Complete modeled expenses were $453.453297; profit and

available earned funds were $699.912828 and $699.912828. 32 profitable deliveries used prior unrestricted earnings. Initial seed capital was $5,000.000000; terminal seed-backed protection was $1,260.566125.

4 Matched growth consequence

Under matched starting capital and contracts, growth minus baseline central profit ranged from $486.138512 to $648.490228, with mean $567.314370. Central collected-delivery differences were 24, 29. 2/2 central pairs increased both settled deliveries and complete modeled profit, against a registered minimum fraction of 75%. These exact separate-business contrasts estimate the added commercial options and resulting behavior. Investment attribution alone is not the matched causal comparison, and algorithmic superiority is not a commercial gate.

5 Connected operating path

Voluntary budget-feasible qualified order precedes production. The admitted service executor produces the actual artifact; a separate checker verifies source-bound complete outcomes before native prepare. Hour-clock clearing follows acceptance. Paid acquisition and capacity contracts are bought only from current unrestricted earnings using an audited state-bound reservation and resolved prepaid resource obligations. Expiring channels expose finite prospects with overlap, fatigue, failed access and renewal costs; exposure is never an order. Customers retain human, rival and refusal alternatives even when the enterprise lacks capacity.

6 Financial defect, retirement and historical impact

The legacy account could cancel a prepared investment, release its reservation and omit incurred costs or remaining liabilities while its former auditor accepted the history. The current canonical account rejects cancellation at execution, reopen, export and independent audit. Pending work must resume and resolve through the existing obligation-aware finish path. Cancelled legacy histories fail closed rather than receive invented reconciliation. The connected writer, authenticated recovery and public auditor share allowed operations, and public audit requires every native action exactly once in causal order, including earned reserve/finish pairs. Omitted native actions, reordered entries, direct writer bypass and duplicate claims are rejected. These are engineering qualifications of the current source, separate from the commercial outcomes. A separate preserved-record scan verified 20 archive parts: 160 prior confirmation002 worlds (57,948 actions) and 13 preserved completed worlds from incomplete confirmation001 (5,159 actions) contained 0 cancellations. That scan is not a new replay or a completion claim for the interrupted experiment. Scan SHA256: edb2cbc208e86968d5139c047a60cd71d6e04a3eed60e0c14b057a5b2cd7dafb.

7 Recovery and independent verification

Every monetary command is recorded as an exact signed write-ahead intent before native mutation. Operating state, event queue and prepared decision are separately sealed against the retained local simulation key and a native tape prefix. Crash tests cover startup, qualified order, production, acceptance and clearing/tax acknowledgment loss. Public exports omit private keys and cannot reopen accounts; they support independent audit and fresh reproduction. Storage protection is limited to the supported operator-owned local POSIX filesystem.

8 Cost and inference limits

All amounts are simulated microUSD. Complete modeled costs include development/search/qualification/setup, acquisition including unsuccessful and unused exposure, onboarding, production, supplier, verification/support, correction envelopes, maintenance, payment fees and conditional tax. Exact pinned runtime dependencies and local CPU are checked or recorded separately. Host and model billing are unavailable and remain explicit envelopes or

unknown; no zero-billing inference is made. Human complete-work hours and fully loaded wage proxies are authored commercial references. No actual paid frontier-model inference, live customers, outreach, financial transactions or deployment occurred. The central enterprise charges setup once at $75.000000, with maintenance $0.100000 per day. The delayed-and-expensive region charges $500.000000 setup, longer collection and channel lead times, higher production/channel costs, nonpayment and a supplier outage. These envelopes define conditional cost regions; the central result is not absolute profitability under an unobserved bill.

9 Scale and unmet milestones

Exact aggregation of native records reconciles overlapping collected-delivery prefixes and all expense/cash flows. This validates accounting aggregation, not a forward buyer or production model. The representative enterprise executed 1707 hours; its trailing-365-day collected amount is $1,153.366125, with complete 365-day history: False. Trailing collections, whole-horizon annualization, cumulative revenue and valuation are distinct. Native million-to-billion targets and their nonattainment records remain in each GROWTH.json. The separate PR22 and PR23 hypothetical billion-dollar projections use different capital, offers, channel contracts, allocation policies, outreach costs and reserve semantics. They remain UNBRIDGED_NATIVE_SCALE; neither model's fastest result is selected as the native enterprise forecast. Finite authored case frequencies are not calibrated attainment probabilities or time distributions.

10 Boundaries and next action

The operating implementation, conditional commercial result and growth result are separate outcomes. Small synthetic complete services and authored buyer/channel/supplier behavior do not establish empirical market demand or autonomous invention superiority. The frozen source inventory, finite audience and permanent native refund tails remain real edition constraints. Follow-on construction must earn or explicitly seed its own resources; no balance is copied between evaluation businesses. Use matched realized incremental contribution to retain/renew channels and capacity; close finite artifact/audience/working-capital constraints with a new costed qualified capability before claiming a native scale bridge. Historical aggregate billion projections remain separate hypotheses.

11 Unpriced resource sensitivity

Actual host and model billing is unavailable. The representative modeled profit would be eliminated by additional unpriced enterprise costs of $699.912828. The declared setup, service, maintenance and support envelopes are simulation assumptions; they are not zero-cost or measured-billing assertions.

12 All exact matched contrasts

Seed / region	Extra paid	Extra collections	Extra profit	Both covered
2610301901 / central	24	$755.819375	$486.138512	True
2610301902 / central	29	$976.300500	$648.490228	True
2610301903 / delayed and expensive	0	$0.000000	$0.000000	True
2610301903 / weak channel	0	$0.000000	$0.000000	True

13 All registered economic regions

Region	Arm	N	Paid	Modeled profit range	Covered
central	baseline	2	10-12	$155.904588 to $213.774316	2/2
central	growth	2	36-39	$699.912828 to $804.394816	2/2
delayed and expensive	baseline	1	7-7	$-331.051116 to $-331.051116	1/1
delayed and expensive	growth	1	7-7	$-331.051116 to $-331.051116	1/1
weak channel	baseline	1	5-5	$38.774860 to $38.774860	1/1
weak channel	growth	1	5-5	$38.774860 to $38.774860	1/1

14 Representative financial state

Measure	Simulated USD
Recognized revenue	$1,153.366125
Collected payments	$1,153.366125
Incurred complete modeled costs	$453.453297
Paid costs	$453.453297
Profit	$699.912828
Cash	$5,699.912828
Receivables	$0.000000
Unpaid liabilities	$0.000000
Native tail reserves	$1,160.566125
Custody reserves	$0.000000
Working reserve	$100.000000
Unrestricted earned funds	$699.912828
Seed capital	$5,000.000000
Seed-backed protection	$1,260.566125

Protected balances overlap: total seed-backed protection includes the native tail and working reserve.
