AGI ALPHA: the released enterprise runs, earns and expands

Actual downloaded-release evidence / 31 October 2026 UTC

ACTUAL RELEASED OPERATION PASSED its declared runtime gates. Conditional simulated commerce; actual downloaded-release reproduction, not untouched confirmation.

1. Published, downloaded and operated

The actual released implementation completed its full default design, resumed the same accounts without changing completed native finances, and passed independent native/operating and extracted-public-copy audits. Six supported commands returned zero. Kernel-accounted CPU was 1790.967006 seconds against 2,400; wall time was 603.461621 seconds against 900. The actual eight-world raw package is retained and differs from the released two-world engineering SMOKE asset.

Actual eight-world raw ZIP SHA256: `d90bc6efa9640966ae6727b7704dbfc5 8370b00d1134471717d6cacb77c73a2b`

Immutable release 429629021; workflow 41150978910, job 124393902894, artifact 13024935015.

Durable actual raw records and reassembly; independent derived financial reconstruction.

Design and evidence level

Eight separately funded businesses form four matched baseline/growth pairs, not eight iid independent trials. Each business starts with $5,000; pairs share declared exogenous seeds, costs and buyer clocks, while growth adds earned-financed acquisition/capacity to the retained initial means. This is a mechanism ablation, not controller optimality against a control with equivalent expansion options. No accounts or earnings are pooled.

Failure preservation and resource scope

Historical failures remain failures: the original economic run used 1,416.974067 CPU against 600; the first released attempt at 10bdb used 2,506.000343 CPU against 2,400 and lost its raw operating records. Neither is relabeled by this later successful reproduction. All real commerce remains zero; actual host/model billing is unknown, not zero. Resource coverage: POSIX kernel self plus waited descendants; post-command CPU checks and a live wall bound, not live aggregate-CPU preemption. Initial asset verification and unavailable host/model billing are outside this runtime counter.

2. Native finances and matched consequences

USD rounded to cents; exact microUSD/native record hashes remain in PUBLICATION.json and the raw archive. C1/C2=central seeds 2610301901/1902; H/W=high-cost/weak-channel seed 2610301903. B=baseline, G=growth. Earned counts are profitable earned-funded continuations; native reservation totals also include assets and unsuccessful work.

World	Accepted/paid/earned	Collected	Costs	Profit	Cash
C1 B	12/12/9	397.55	183.77	213.77	5,213.77
C1 G	37/36/32	1,153.37	453.45	699.91	5,699.91
C2 B	10/10/6	316.59	160.68	155.90	5,155.90
C2 G	39/39/35	1,292.89	488.49	804.39	5,804.39
H B	8/7/0	234.52	565.58	-331.05	4,668.95
H G	8/7/0	234.52	565.58	-331.05	4,668.95
W B	6/5/1	155.91	117.14	38.77	5,038.77
W G	6/5/1	155.91	117.14	38.77	5,038.77

World	Receivable	Liability	Protected	Available cash	Earned
C1 B	0.00	0.00	499.95	4,713.83	213.77
C1 G	0.00	0.00	1,260.57	4,439.35	699.91
C2 B	0.00	0.00	418.59	4,737.32	155.90
C2 G	0.00	0.00	1,400.69	4,403.71	804.39
H B	0.00	0.00	335.92	4,333.02	0.00
H G	0.00	0.00	335.92	4,333.02	0.00
W B	0.00	0.00	256.91	4,781.86	38.77
W G	0.00	0.00	256.91	4,781.86	38.77

Protected=tail+custody+working+outstanding investment reservations. Seed-backed protection overlaps these measures; do not add it again.

Adding earned-financed expansion to retained means

Pair	Extra paid	Extra collected	Extra profit
C1	24	755.82	486.14
C2	29	976.30	648.49
H	0	0.00	0.00
W	0	0.00	0.00

Representative C1 growth produced 37 accepted outputs and collected 36 deliveries for 13 paying customers (10 repeat). Collections 1,153.366125 minus complete modeled costs 453.453297 yield 699.912828 USD profit. 32 profitable continuations used prior earnings. Separate source-bound checkers verify actual deterministic reconciliation, KPI and evidence artifacts. Same-session/host checking paths are not external institutional certification. Pairing matches declared exogenous seeds and capital; controls deliberately retain initial means, not equivalent expansion options. Counts are finite authored cases, not calibrated probabilities. All eight obligations remain covered; high-cost losses and failed growth remain visible.

3. Productive earnings and the next constraint

Both central growth businesses each buy three acquisition contracts (18.75 USD) and four capacity contracts (32 USD), all funded by prior earnings and later used in settled work. Across all eight worlds, 99 native earned reservations were covered by prior cash/earnings; 72 asset/order links are nonadditive. C1 growth makes 7 native EARNED-funded acquisition/capacity purchases totaling 50.75 USD. The table follows each invoice through purchase/activation/expiry and subsequent settled use. Rejected work, failed exposure, unused capacity and fees remain costs. Linked collections are attribution, overlap across asset kinds, and must not be summed as incremental revenue; the whole-enterprise paired differences on page 2 measure the consequence.

Invoice	USD	Purchase/active/expiry h	Later paid	Linked collected
channel-11	6.25	264/312/816	19	632.32
capacity-19	8.00	456/480/984	3	104.90
capacity-20	8.00	480/504/1008	1	40.48
channel-34	6.25	816/864/1368	4	119.83
capacity-44	8.00	1056/1080/1584	4	134.28
capacity-45	8.00	1080/1104/1608	2	62.12
channel-57	6.25	1368/1416/1920	2	62.12

Cash and protection

Profit is not unrestricted liquidity. For actual C1, growth minus baseline: +486.138512 USD profit -760.619375 USD extra protected balances =-274.480863 USD available-cash change. C1 growth still has 1,260.566125 USD of seed-backed protection. Permanent full-principal-plus-fee tails therefore constrain seed-independent cash expansion despite profitable delivery.

Conditions and limits

Central growth increases both settled volume and modeled profit in 2/2 matched cases. Weak-channel pairs add zero growth; the delayed/high-cost pair adds zero growth and loses 331.051116 USD per business. Central setup 75 USD and 0.10 USD/day maintenance are disclosed complete-cost envelopes; high-cost setup is 500 USD with longer clearing/lead times, higher production/channel charges, nonpayment and supplier outage. Human times/wages and buyer/channel behavior are authored assumptions, not measured demand or bills. All registered native 1M, 10M, 100M, 1B and 10B trailing-365-day collection targets remain unreached; finite case frequencies are uncalibrated and no forward native-to-billion bridge is established. Performance scope is separate: the final guarded source reduces 13.978736472 to 10.890092070 process-CPU seconds (22.0953%) on one exposed 12-day fixture. The 19.507% candidate miss and 26.5820% preguard timing remain preserved; the final guard is not assigned the faster prior-source observation. These engineering timings do not replace the actual full-run kernel CPU above. The 75 CPU financial target was exceeded; prior unmetered overhead is not claimed zero.

Next economically justified construction

The next construction is an explicitly priced, obligation-preserving settlement/recourse contract with qualified maturity, native reservations and adverse-case verification. It must remove a measured capital constraint without waiving buyer remedies. Existing liquidity diagnostics and portable-offer packaging are supporting pieces, not an implemented financing asset or new service. Ordinary qualified methods remain preferred when they deliver greater complete-cost contribution. Source-bound run/resume/public-audit receipts and all eight raw states govern these claims. Public export supports audit and fresh reproduction, not original-account takeover. This read-only documentation increment ran no commerce or audit replay.
